Landscape Screening Applications

Original 1/28/94

To assist you in preparing landscape plans that may be approved with a minimum of delay or plan revisions, the following information has been prepared. Article 8 of the *Site Development Ordinance* (attached) contains guidelines and regulations used to evaluate landscape plans. You or your representative should attend the Site Development Committee meeting to answer questions and to hear comments.

It is the applicant's responsibility to submit a landscape plan for approval six to eight weeks before final inspection is requested. While the applicant may submit the landscape plan at any time, the Site Development Committee, as a rule, will defer action on the plan at least until the roof and framing has been installed. This allows the Committee to assess the impact of the structure as seen from outlying areas.

Plan Requirements

All landscape plans submitted for Site Development Committee review and approval should include the following information. A modified copy of the grading and drainage plan (from your site development permit application) that fits these criteria may be used.

- North arrow and Scale: 1 inch = 20 feet
- All proposed outdoor lighting
- The entire site shall be shown, including all property lines, improvements, road rights-of-way, pathways and easements.
- Relation of roadway (pavement) to property lines and rights-of-way. (label all streets adjacent to the property).
- Final grades in five (5) foot maximum contours if the lot averages over five (5) percent slope, and two (2) foot contours if less than five (5) percent slope.
- Building footprint for residence and all other structures, decks, driveways and other hardscape such as walkways, patios, pools and decking, and tennis courts (existing and proposed development area).

- Future development should not be shown on the plans except for concept reference. Any future or planned development should be clearly marked as such.
- A table with size, number and species of all proposed plantings shall be included on the landscape plan. Latin names should be used as well as common names.

Criteria for Landscape Plans:

Landscaping shall be planted so that structures are unobtrusive from off-site views, in conformance with the *Site Development Ordinance*. Landscape plans are usually required for major additions and new residences, and may be required for minor projects. The Town requires only the amount of landscaping needed to satisfy the requirements of Article 8 of the *Site Development Ordinance* and the Town's *landscape policy* (see Resolution #88-86, attached). The size of the structure, the types of materials and the proposed colors determine the amount of required landscaping. Applicants should consider the following criteria when preparing their landscape plan:

- Location and size (at maturity) of all plants proposed to meet the requirements of the *Site Development Ordinance*, including elevations in sufficient detail to allow the Site Development Committee to evaluate the adequacy of proposed landscaping.
- See *landscape policy*, Resolution #88-86, Article 8 of the *Site Development Ordinance*, and the list of drought resistant plants.
- No structures (including gateposts, columns, pillars and monument style mailboxes) are allowed in road rights-of-way or pathways. The fencing requirements in the Zoning Ordinance (Section 10-1.504) are also applied to gateposts, columns and pillars. Zoning permits are required for any proposed fences or monuments.
- Driveway columns or pillars may not exceed six feet in height, **including any light fixtures**. Only two lights may be placed within setbacks.
- Landscaping and sprinklers are not permitted in dedicated pathway easements, or within five feet of pathways.
- Existing trees and vegetation shall be shown and labeled as such.
- Placement of plants must be sufficiently distant from roads and pathways so as to not cause future obstructions. Road rights-of-way generally extend beyond the paved surface of the roadway.
- Structures along Interstate 280 will require additional levels of landscape mitigation.
- No irrigation may be placed within rights-of-way

- Outdoor lighting shall be placed so as to be unobtrusive to neighboring properties. Lighting shall be down shielded and low wattage (the light source may not be visible from off-site). Floods and uplights are discouraged. Other than two driveway lights, lighting may not be located within setbacks.

Los Altos Hills Municipal Code

Article 8-Landscaping

Sec. 10-2.802- Landscaping policies

- a. *Erosion.* Landscaping shall be required to control erosion, retard soil creep, and reduce the potential for landslides.
- b. *Noise.* Landscaping and berms may be required to shield Town residents from unnatural noises, such as those from freeways, arterial streets, and nonresidential land uses.
- c. *Visual effects.* Landscaping shall be required to mitigate the visual effects of development from off the site.
- d. *Preferred plants.* Landscaping should utilize fire retardant species. Native or naturalized plants or other plant species that blend naturally with the landscape should generally be favored.
- e. *Maintenance.* Landscaping shall be maintained in healthy condition by property owners and shall not intrude into easements, paths, or the lines-of-site required at intersections and along roads.
- f. *Tree preservation.* Every feasible attempt should be made to preserve existing trees.
- g. *Views.* In order to prevent blockage of scenic views and vistas, the height at maturity of proposed plants and trees shall be considered in determining the appropriateness of landscaping plans.
- h. *Amount required.* The Town shall require only the minimum amount of landscaping necessary to implement the above policies. The amount of landscaping required by the Town shall be determined by the size of structure, the types of materials, and the colors proposed for structures. Structures that blend with the natural landscape will normally require less landscaping for screening purposes than will structures composed of non-natural materials and bright colors.
- i. Where slopes are too steep to support continuous ground cover, niches and ledges may be required for planting. Landscaping may be required for cuts and fills along public roads.

Sec. 10-2.803- Site development

Landscaping to render structures inconspicuous from off-site and in conformance with the provisions of this chapter shall be required by the Site Development Authority as a condition of approval of a site development application.

Sec. 10-2.804-Preferred species list

The Planning Director shall maintain a preferred species list for distribution to applicants. The list shall note any special qualities of particular plant species, such as size at maturity, drought or fire resistance, soil requirements, etc.

Sec. 10-2.805- Size and placement

The number and size at maturity of plants used to screen and break up the outline of structures should be scaled to the size of the structures and the siting angles from prospective viewing points, the types of building materials used, and the color scheme of the structure. In evaluating the adequacy of proposed landscaping, the following guidelines shall be considered:

- a. The shape, outline, color, and form of all structures shall be rendered unobtrusive when viewed from any location off-site at the time landscaping has matured.
- b. The type of landscaping used shall be sensitive to the natural topography. For example, on steep slopes, plants that will maximize erosion control should be selected.
- c. The type of landscaping shall be appropriate for the composition of the soil in which the plantings are to be located. Required landscaping should thrive with as little maintenance as possible.

Sec. 10-2.806- Irrigation systems

Sprinklers and other landscape irrigation systems shall not be allowed in any public

Sec. 10-2.807- Maintenance of landscaping

Landscaping shall be maintained in a natural, healthy condition. Diseased or dead plants shall be replaced. Combustible brush shall be removed from the site. A minimum of twelve (12') feet vertical clearance shall be maintained over driveways, public pathways and public rights-of-way. Landscaping shall be maintained according to the conditions of any performance bond filed with the Town.

Sec. 10-2.808-Fences and walls

Any wall or fence may be required to be landscaped.

Prepared by Environmental Design & Protection Committee

INTRODUCTION: LANDSCAPING GOAL

There are many factors that go into designing a landscape for a residence in a community like ours. The Town of Los Altos Hills remains one of the open country areas left in the congested, expanding cities of the Bay Area. A great number of our homes border on the natural, undeveloped areas which provide a visual backdrop for much of the San Francisco Peninsula. Our goal in landscaping is to minimize the visual impact of the housing structures with plantings which blend with the natural beauty of our native surroundings.

DESIGN CONSIDERATIONS

At the time of new construction, owners are required to present a plan for managing erosion on slopes and for mitigating the impact or view of new structures from off-site. The purpose is to keep the Town looking less urban, to preserve the soil and to retain the original contours as much as possible. Future plantings and changes should continue with the same goals. The General Plan calls for landscaping to create maximum compatibility of development with the natural environment. As a general guideline, the Town recommends informal plantings. To achieve this, plant in random or staggered groups of a variety of species rather than formal rows of hedges. This method will avoid future difficulties in replacement if and when plants are killed by gophers or other problems. Frequently plantings are used to conceal the view of a structure, provide privacy, manage erosion or mitigate wind or noise. Trees are often the first thought but remember trees grow tall and wide. The bottom branches die out and what was meant to be hidden will become visible again. Additionally, our tree may now block your neighbor's view or sunlight or interfere with utility lines, while it no longer serves your original purpose. Shrubs may be a better answer. Most evergreen (non-deciduous) shrubs will top out below 20 feet and continue for years to give privacy clear to the soil level.

Other design considerations are the water needs of the plants you select. Grouping plants according to their water needs will improve their success. Water saving will be a big item of consideration as the State's population increases in the future. Water supplies are finite and we will all be required to minimize our use of landscape water in the near future. Lawns are the biggest user of water, so try to have only the amount of lawn you really need for your family use and use drought tolerant plants elsewhere. Some of the easiest drought tolerant plants are the ones that evolved here naturally. These are our own native plants. (See Table 1: Native Plants)

Also, when designing your landscape, consider the site. Is it an exposed hill or a shady valley? Use plants which are adapted to these conditions.

In Los Altos Hills, the best time to plant is in the fall at the time the rains are beginning. The soil is still warm, thereby allowing the roots to establish. The air is cooler so there won't be much top growth and the rains will do most of the watering for you. However, if the rains are inconsistent, supplemental water will be needed. Fall planting will give your plants a head start

on early spring growth. If you miss the fall planting season, winter or spring are second best and summer least favorable. The Sunset Western Garden Book is a good source of information for appropriate plantings for our climate. According to Sunset, our zone is 16. All plantings should be chosen for their adaptability to this zone.

LIVING WITH CALIFORNIA OAKS

In Los Altos Hills, we are fortunate to have many native oaks. Oaks give us shade and shelter, increase our property values, create carefree beautiful landscapes and provide food for native wildlife. Oaks are very low water and low maintenance trees. Unfortunately, inappropriate landscaping, such as lawns or high water plantings, and construction practices can seriously damage these trees. Often the damage is not evident till years later. As homeowners among these beautiful trees we are in the best position to protect and enhance our native oak resources. Careful planning and design can provide benefits for both people and oaks.

OAK ROOTS

The roots of mature oaks grow predominately within the upper 3 feet of soil. Most of the roots responsible for uptake of water and minerals are concentrated within 18 inches of the surface. Although the roots typically radiate well beyond the periphery of foliage (drip line), much of the active root system is within the drip line. Roots are sensitive to environmental change such as compacting, paving, grading and increased moisture. In summer, oaks are dormant and do not need water. During the warmer days of summer, water actually promotes the growth of soil fungi which will kill the tree very slowly (over 5 or more years). Also, the tree needs oxygen in the soil and too much water will displace the soil's oxygen.

ACTIVITIES WHICH CAN DAMAGE TREE ROOTS

SOIL COMPACTING-Frequent traffic (human, livestock, driving or parking of vehicles) within the drip line squeezes soil particles together, eliminating natural air space thereby reducing infiltration and storage of water and air.

PAVEMENT-Impermeable soil coverings restrict the amount of air, water and minerals available to the roots thus impairing root growth and function.

GRADE CHANGES-This involves either the addition or removal of soil within the drip line. Excavation (cut) can sever and expose roots. Addition (fill) can suffocate them.

TRENCHING-Trenches that cut across the drip line cut essential roots. This impairs the tree's ability to obtain water and essential elements which may cause death, die-back or gradual decline.

DRAINAGE CHANGES-Any change that causes water to collect around a tree, especially the trunk, is harmful. Likewise, a grade change that diverts a source of water that the tree depends on may cause drought stress.

SOIL CONTAMINATION-Avoid storing and discarding harmful chemicals or materials such as; herbicides, petroleum products, building materials or waste water near oaks.

LANDSCAPING-There are just a few California native plants that can be used in landscaping oak gardens. See table 1: Native Plants *'d items. It is best to keep the area within the drip line relatively open. Use plants as accents rather than ground covers. Select plants that tolerate drought and plant no closer than 10 feet to the trunk. Avoid all planting under declining oaks.

OVER FEEDING-As a general rule, native oaks should not be irrigated. Frequent irrigation displaces much of the oxygen in the soil. This can lead to reduced growth and vitality and increased susceptibility to insects and diseases. One exception, however, is during drought years. If the winter is unusually dry, supplemental deep watering in the spring or summer can complement natural rainfall. Water the soil from halfway between the trunk and the drip line to 10-15 feet beyond. Allow the water to penetrate 18-24 inches. This may take 4-6 hours and should only be done one time per month.

MULCHING AND FERTILIZING-Keep soil surface mulched with 2-4 inches of natural leaf litter, wood chips or gravel. Do not place directly against trunk. Under such conditions, healthy oaks do not need added fertilizer. However, if leaf litter is regularly removed, you may need to fertilize. The ideal time is in the spring. Broadcast over the tree's root zone, lightly water into the soil, avoiding the area within 10 feet of the trunk. Use fertilizers high in Nitrogen (N) such as calcium nitrate, ammonia sulfate, ammonia nitrate or urea. Complete fertilizers with nitrogen, phosphorus and potassium are more expensive and generally unwarranted.

PRUNING-Large old oaks are likely to need thinning and cabling. Avoid excessive pruning, removing no more than 10-20% of the foliage in any one year. **WARNING!** Incorrect pruning can lead to serious problems. Consult a professional arborist certified by the Western Chapter of the International Society of Arboriculture.

DETECTING HEALTH PROBLEMS: SIGNS OF ADVANCED DECLINE OR DECAY

Thin, sparse foliage

Poor growth

Yellow, undersized leaves

Dead branches and limbs in upper canopy

Wilted, brown leaves during spring and summer

Many short shoots growing on trunk and branches

Mushrooms at tree base or on the roots in fall or early winter

Conks – shell-like mushrooms on trunk

Cavities in trunk

White, fan-shaped mats of fungus under the bark at soil line

Soft, punchy wood

Wet, oozing areas on the bark

If any of these problems occur, residents should contact a certified arborist.

RIPARIAN HABITAT

The stream corridor, including the vegetation along the bank, is known as riparian habitat. This high moisture environment supports a great diversity of plants and wildlife. The corridor is an invaluable natural resource that serves as a conduit for floodwater, replenishes surface and ground water and contributes a host of aesthetic and recreational benefits. By protecting and preserving this delicate area you can prevent or minimize erosion, preserve water quality, contribute to the survival of fish and wildlife and help avoid flood damage. Your primary goals along stream areas are to minimize erosion or contamination from adjacent properties and preserve the natural state of the area by restoring any damaged areas with native plants. The following guidelines will help protect and enhance your living stream.

Always use native plants (No invasive or non-native plants). (See Table1: Native Plants) and (Table 2: Invasive plants).

Keep pets and livestock away from the riparian area.

Never use fertilizers or pesticides near the riparian zone.

Protect existing vegetation and natural grades during construction.

Control erosion by protecting areas where flowing water meets bare soil. This may be accomplished by reducing the speed or redirecting the water to vegetated areas or by replanting with native ground cover.

Do not rake up leaf litter or prune native plants.

Do not dump yard wastes into stream area.

PROBLEMS IN THE HILLS

Our community because of its setting on the edge of natural areas has some special challenges. Fire protection, erosion and flood control can be aided by the use of appropriate plantings. Our abundant wildlife must be protected from poisonous plants and chemicals, but must also be considered in plant selections that attract rodents, deer or raccoons.

EROSION AND FLOOR CONTROL

Soil stability can be promoted by avoiding and controlling water runoff. Limit the amount of hardscape (asphalt, concrete and other impermeable pavement) to avoid rapid run-off of large amounts of water. Landscape irrigation of a slope is equivalent to 25-60 inches of rainfall per year. Over-watering, the cause of many slope failures, can equal 100 inches of rainfall per year when the winter rains are added. Use of drip or no irrigation would be recommended on any slope.

When planting, avoid cutting into the bottom of the slope because what is above will likely be washed down. Disturb the soil as little as possible and use appropriate drought resistant plants with deep roots. Some native plants which will help are dwarf coyote bush, *baccharis pilularis*, some of the *Ceanothus* types, native bunch grasses, native roses and toyon. Natural and constructed water courses such as creeks and drainage ditches must be kept free of debris. Any areas of land that are disturbed during construction should be quickly re-vegetated; preferably with native plants with deep roots.

FIRE PROTECTION

To prevent the likelihood or severity of wildfires, create a 30 foot fuel break area around your home using vegetation that has low flammability and is low growing. Remove dead plants and clean out dead material from your living plants in such a way so that it does not accelerate erosion and flood potential. Trees should be kept a distance from any structure at least as wide as the mature crown. Additionally large shrubbery under trees can create a fire ladder allowing the flames to ignite the tree foliage. Pines, junipers, cypress and eucalyptus trees burn especially fast and should not be planted near the house.

WATER CONSERVATION

Our climate is considered a Mediterranean climate with cool, wet winters and a long dry period from May to October. Supplemental watering should begin when the rains cease (this varies from February to June but averages about May 1).

The plants that are the best adapted to do well on your site are the ones that are native to the area closest to you. They are drought tolerant and they provide much needed wildlife value for our birds, butterflies and other creatures. (See Table 1: Native plant list).

Minimize lawn area. Grass not only demands frequent watering but is easily destroyed by tunneling animals such as gophers and moles. Instead consider drought tolerant ground covers such as various species of *ceanothus*, a rock garden or a meadow of wildflowers. If lawn is functionally required, use a drought tolerant species. The optimum landscape design for water conservation would include no more than 1/3 high water use plantings, 1/3 moderate and 1/3 low water use plantings.

INVASIVE PLANTS

Certain plants will invade into the surrounding countryside. Some invasive plants have gotten loose into roadsides and native habitats. These plants which have been introduced into California from other parts of the world have no natural enemies and spread rampantly into our open space. There they crowd out native plants and become a monoculture. This has a serious impact on our wildlife which depends on the natural variety for food and shelter. (See Table 2: Invasive plants).

POISONOUS PLANTS

Some plants are poisonous to people and livestock. No plant which is poisonous should be allowed in any enclosure for an animal. Some of our common garden plants are poisonous if eaten by children. Most notable is Oleander which is widely planted as a drought tolerant ornamental shrub. Others include the Rhododendron family. (See Table 3: Poisonous plants).

COPING WITH WILDLIFE

We live in an urban/rural interface and as much as our plantings might attract the birds and butterflies, they also attract rodents, deer and raccoons. To protect against gophers, place a 1 inch or less wire mesh basket in the planting hole. It is almost impossible to protect lawns against moles and gophers, so take this into consideration in your overall landscape plan. Dense ground covers such as ivy, vinca and the thickets of blackberries can harbor rats. Deer protection is difficult. Much of what the deer will eat is variable and depends upon his degree of hunger. There are some plants that deer consistently do not eat. These are mostly the spiny ones and those with strong odors or fragrance but they adore plants in the rose family which includes many stone fruits. If you need to protect specific plantings, i.e. vegetable gardens, the best protection is fencing. Fences to keep deer away need to be 6 feet high or more. A double row of fences of 4 feet high and 4 feet apart will also do the trick. However, then you have a weed problem in the inter-space. At Hidden Villa, a sheep-run between the fences keeps the weeds down. Fences require a building permit. Remember, however, that wildlife needs to migrate for food and water so please leave open corridors through your property.

LANDSCAPE MAINTENANCE

New Plantings

Watering may be needed for at least the first two summers or until the plants can make it on their own. Water only sparingly after that, remembering about the growth of soil fungi during the summer.

PRUNING AND TRIMMING

It is important to keep large trees correctly pruned to allow for safety and balance and prevent storm damage. Consult a certified arborist. Maintain our shrubbery along pathways, roadways and driveway intersections to allow proper visibility and accessibility. Also, remember your and your neighbors scenic views can disappear when trees and shrubs are not kept properly trimmed.

IRRIGATION

When using automatic or manual irrigation do not over-water creating run-off or flooding to adjacent properties. Use drip system irrigation or a soaker hose whenever possible to avoid erosion and conserve our valuable water resources. Also, remember to change automatic timers as seasonal weather changes.. because of fluctuating high water pressure in some areas, a

pressure regulator valve should be installed on your landscape watering system to prevent ruptured pipes.

WEED CONTROL

The fire district will ask you to control weed growth. Here are some recommendations to handle this often overwhelming problem. The following list is in order of preference and environmental sensitivity.

1. Mowing, string or blade trimming and grazing
2. Layers of chip mulch
3. Glyphosate sprays such as “Roundup” in open areas or “Rodeo” near water courses. Read the label carefully first and follow directions explicitly.
4. Plowing and disking will cause soil erosion from wind and water. It has also been responsible for fires (from sparks off engine or hitting rocks). Timing of turning the soil is important. If seed has already formed and dropped, rototilling will only replant seed for next year’s weeds.

COMPOSTING

Composting your yard waste at home can produce valuable nutrients for your garden while decreasing the impact on landfills. Classes are available monthly in Los Altos for Los Altos Hills residents

HERITAGE TREES

Los Altos Hills has a Heritage Tree Program, and the so designated coastal live oak at Town Hall is a fine example of such a tree. We are looking for other outstanding California Native trees that could be honored in our town. Property owners with such a tree are encouraged to contact the Town Hall office and let us know. The Environmental Design and Protection Committee with the help of an arborist will examine and consult on the tree. If the tree is suitable and healthy, an award will be given and the tree will be identified as a Heritage Tree of Los Altos Hills.

TABLE 1:
NATIVE PLANTS

These native plants grow wild in or near Los Altos Hills and will grow easily in your garden.

TREES

Botanical Name	Common Name	Foliage
<i>Acer macrophyllum</i>	Big-leaf Maple	deciduous
<i>Aesculus californica</i>	California Buckeye	early deciduous
<i>Arbutus menziesii</i>	Madrone	evergreen
<i>Lithocarpus densiflora</i>	Tanbark Oak	evergreen
<i>Plantanus racemosa</i>	Western Sycamore	deciduous
<i>Populus fremontii</i>	Fremont Cottonwood	deciduous
<i>Pseudotsuga menziesii</i>	Douglas Fir	evergreen
<i>Quercus agrifolia</i>	Coast Live Oak	evergreen
<i>Quercus chrysolepis</i>	Canyon Oak	evergreen
<i>Quercus douglassii</i>	Blue Oak	deciduous
<i>Quercus kelloggii</i>	California Black Oak	deciduous
<i>Quercus lobata</i>	Valley Oak	deciduous
<i>Sambucus caerulea</i>	Mexican Elderberry	deciduous
<i>Sequoia sempervirens</i>	Coast Redwood	evergreen
<i>Torreya californica</i>	California Nutmeg	evergreen
<i>Umbellularia californica</i>	California Bay	evergreen

SHRUBS

Botanical Name	Common Name	Foliage
<i>Amelanchier pallida</i>	Serviceberry	deciduous
<i>Arctostaphylos andersonii</i> *	Heart-leaved Manzanita	evergreen
<i>Arctostaphylos glauca</i> *	Big-berried Manzanita	evergreen
<i>Arctostaphylos Manzanita</i>	Dr. Hurd	evergreen
<i>Baccharis pilularis</i> *	Dwarf Coyote Bush	evergreen
<i>Ceanothus cuneatus</i> *	Common Buck Brush	evergreen
<i>Ceanothus thyrsiflorus</i> *	Blue Brush	evergreen
Ceanothus (many species)		
<i>Cercis occidentalis</i>	Western Redbud	deciduous
<i>Cercocarpus betuloides</i> *	Mountain Mahogany	evergreen
<i>Cornus californica</i>	Creek Dogwood	deciduous
<i>Cornus grabata</i>	Brown Dogwood	deciduous
<i>Corylus cornuta californica</i>	California Hazelnut	deciduous
<i>Dendromecon rigida</i> *	Bush Poppy	evergreen
<i>Diplacus aurantiacus</i> <i>Mimulus</i> *	Sticky Monkey Flower	shrubby perennial
<i>Fremontodendron</i> *	Flannel Bush	evergreen
<i>Garrya elliptica</i>	Coast Silktassel	evergreen
<i>Heteromeles arbutifolia</i>	Toyon	evergreen
<i>Holodiscus discolor</i>	Cream Bush	deciduous
<i>Lepechinia calycina</i>	Pitcher Sage	evergreen aromatic

Lonicera involucrate	Hairy Honeysuckle	evergreen
Mahonia pinnata*	Shinyleaf Barberry	evergreen
Malacothamnus arcuatus	Northern malacothamnus	evergreen
Myrica californica	Wax Myrtle	evergreen
Oemleria cerasiformis	Oso Berry	deciduous
Physocarpus capitus	Pacific Ninebark	deciduous
Prunus ilicifolia*	Hollyleaf Cherry	evergreen
Rhamnus californica*	Coffeeferry	evergreen
Ribes aureum*	Golden Currant	deciduous
Ribes sanguineum	Red Flowering Currant	deciduous
Ribes Speciosum	Fuchsia Flowering Gooseberry	deciduous
Rosa californica*	California Rose	deciduous
Salvia leucophylla	Purple Sage	deer proof
Salvia sonomensis*	Sage	perennial
Symphoricarpos albus	Common Snowberry	deciduous
Symphoricarpos mollis	Creeping Snowberry	deciduous
Trichostemma lanatum	Wooly Blue Curls	evergreen

Low Growing Native Plants

Botanical Name	Common Name	Foliage
America maritima	Sea Pink	evergreen
Clarkia amsonia (Godetia)	Farwell-to-Spring	annual
Eriogonum fasciculatum*	California Buckwheat	evergreen
Eriogonum grande*	Red Buckwheat	evergreen
Eschscholzia californica	California Poppy	annual
Heuchera sanguinea	Coral Bells	evergreen
I. douglasiana, innominata	Pacific Coast Iris	evergreen
Zauchneria	California Fuchsia	deciduous
(epilobium canum)		

NATIVE GRASSES

Botanical Name	Common Name	Foliage
Elymus glaucus	Blue lyme grass	perennial/sun
Festuca californica	California Fescue	grasses/shade
Melica torreyana		grasses/shade
Nessella cernua	nodding needle grass	bunching/sun
Nessella pulchra	purple needle grass	bunching/sun

* Native plants for under oak trees

TABLE #2:
Invasive Plants

These are plants which seed themselves into wild areas and which will eventually crowd out native plants and reduce natural foods for our birds, insects and other animals. Please avoid planting these and try to remove existing plants where possible.

Botanical Name	Common Name
Ailanthus	Tree of Heaven
Arundo donax	Giant Reed
Cortaderia jubata	Pampus Grass
Cotoneaster spp.	Cotoneaster
Cytisus	French, Scotch or Spanish Broom
Eucalyptus globulus	Blue Gum Eucalyptus
Hedera canariensis	Algerian Ivy
Pennisetum	Fountain Grass
Pyracantha spp.	Pyracantha
Rubus procerus	Himalayan Blackberry
Tamarix	Tamarisk
Vinca major	Periwinkle

*Also included are any non-native plants which have berries or which spread by rhizomes.

It is especially important to keep the above plants from entering waterways.

TABLE #3:
Poisonous Plants

These must be kept out of animal enclosures along pathways.

Arrowgrass
Black Henbane
Black Locust
Bladder Pod
Bluebonnet*
Blue-green Algae
Boxwood
